Trigger Dates

Last Modified on 11/10/2026 12:26 pm EST

Pick the date a deadline counts from, and Pipeline works the rest out on every transaction — for task due dates and scheduled messages alike.

Introduction

The acceptance date moves by two days and nothing on the file is right any more. Inspection, appraisal, the loan contingency, the walk-through: every one of them counted from that date, and every one now has to be worked out again and retyped.

Trigger dates are how you stop doing that arithmetic. Instead of typing a fixed date onto a task, you write down the rule you were working out in your head, three days after acceptance, five business days before closing, and Pipeline fills in the real date on each transaction from the dates already on that file. Move the date it counts from and everything hanging off it moves too. The same dates drive the timing behind your automatic messages, so a checklist and a schedule can count from the same place.

That afternoon of rebuilding a timeline is gone, and it stays gone the next time a deal shifts. A trigger date is where the counting starts from, though, not an alarm. It makes deadlines calculable. It doesn't send anything on its own.

How It Works

An anchor is a date on the transaction, and other dates count from it.

Which Dates Can I Count From?

Six come with every account: **Acceptance Date**, **Close Date**, **Listing Date**, **Expiration Date**, **Transaction Creation** and **Checklist Addition**. The last two are the ones nobody has to type, so a brand-new file can carry a deadline before a single contract date exists. Company settings call them Checklist Trigger Dates and the rule dropdowns say trigger dates — same thing. The six are fixed, but every date field you put on your transactions joins them, which is how a milestone Pipeline doesn't ship gets a date to count from.

Turn on prebuilt fields like inspection dates and earnest money to track the details your team cares about.

See Optional Fields

Build the fields your office needs, and Pipeline treats them like every other transaction detail.

What Does an Anchor Drive?

Task due dates and scheduled messages, drawn from the same set with one exception — a task due five business days before Close Date, a message template queued thirty days after it. Checklist Addition drives task due dates only, so it isn't offered when you schedule a message. The anchor decides *what* you count from; the rule decides *how* Pipeline counts the days, in business days, calendar days, or calendar days that bump to the next business day. Turning an anchor on only makes the date available, so nothing reaches a person until a rule uses it.

Tell Pipeline which days your office is closed, and business-day due dates step right over them.

What Happens When the Anchor Moves?

Everything hanging off it moves too. Pipeline points at an anchor rather than copying it, so editing one recalculates every task due date and scheduled message counting from it, which turns a pushed closing into a single field edit. Until you fill the anchor in, anything counting from it shows no date, and those dates land the moment you enter it.

A due date is what puts a task on your Tasks page, into your reminder emails, and onto your calendar — and taking it back off is how you quiet a task you no longer need.

Frequently Asked Questions

Which dates can I use as an anchor?

Six built-in dates, plus any optional or custom date field you've turned on. The built-in six are Acceptance Date, Close Date, Listing Date, Expiration Date, Transaction Creation, and Checklist Addition.

Where do the Acceptance, Close, Listing and Expiration dates come from?

From the transaction itself. They're the four dates you enter when you add or edit a deal, and everything counting from one of them moves when it changes. See Transaction Dates.

Can I add an anchor of my own?

Yes — build a custom date field and mark it as a trigger date. Once it's on your transactions, it shows up in the date-rule dropdowns alongside the built-in dates.

Can I rename or edit the built-in anchors?

No. The built-in date fields and Pipeline's prebuilt optional dates carry fixed names. If you need a different label, create a custom date field, name it whatever your office calls it, and mark it as a trigger date.

Do anchors work for scheduled messages too, or only tasks?

Both, with one exception. The same anchor can drive a checklist task's due date and the schedule on a message template — for example, a message queued a set number of days before the Close Date. Checklist Addition is the exception: it sets task due dates only.

Why is my task's due date blank?

The anchor it counts from hasn't been entered on the transaction yet. Add that date and the due dates fill in on their own.
